The Law of Large Numbers — Kruskal Count

The Law of Large Numbers — Kruskal Count

The Law of Large Numbers

<u>Observation</u>:

The larger the number of cards we use,
the more likely it is to end on the same card.

The Law of Large Numbers

<u>Observation</u>:

The larger the number of cards (n) we use,
the more likely it is to end on the same card.

<u>Generalization</u>:

The larger the number of trials ($\lim_{n\to\infty}$),
the more likely it is that their sample average ($\bar{X}$) is equal
to the expectation (μ).

The Law of Large Numbers

<u>Observation</u>:

The larger the number of cards (n) we use,
the more likely it is to end on the same card.

<u>Generalization</u>:

The larger the number of trials ($\lim_{n\to\infty}$),
the more likely it is that their sample average ($\bar{X}$) is equal
to the expectation (μ).

$$\Pr(\lim_{n\to\infty} \bar{X} = \mu) = 1$$

The Law of Large Numbers

<u>Generalization</u>:

The larger the number of trials ($\lim_{n\to\infty}$),
the more likely it is that their sample average ($\bar{X}$) is equal
to the expectation (μ).

$$\Pr(\lim_{n\to\infty} \bar{X} = \mu) = 1$$

The probability that the sample average is equal to the expectation, if you have an infinite number of trials, is one.

The Law of Large Numbers

<u>Generalization</u>:

The larger the number of trials ($\lim_{n\to\infty}$),
the more likely it is that their sample average ($\bar{X}$) is equal
to the expectation (μ).

$$\Pr(\lim_{n\to\infty} \bar{X} = \mu) = 1$$

The probability that the sample average is equal to the expectation, if you have an infinite number of trials, is one.
